

**For Immediate Release**

**Kodiak Cuts 1.03% Copper and 0.52% Nickel over 3.85 Metres in New Find at Knucklethumb**

**Vancouver, British Columbia, September 28, 2005** - Kodiak Exploration Limited (TSX.V: KXL) is pleased to report the discovery of two new zones of copper-nickel mineralization that are associated with a cluster of geophysical anomalies in a 2 kilometre by 1 kilometre gabbro body in the Aidan area of the Knucklethumb Lake Property in northwest Ontario. The zones have a combined strike length of 215 metres. Channel samples across one zone have returned assays of up to 1.03% copper and 0.52% nickel over a true width of 3.85 metres. The second zone contained values of up to 0.58%

**Snake Zone**

copper and 0.78% nickel over a width of 2.0 metres. Channel samples also returned values of up to 0.10% cobalt, 0.3 g/t palladium and 0.6 g/t platinum. Elsewhere in the gabbro grab samples of up to 0.9% copper with 0.3 g/t gold have been found associated with an ultramafic unit in a 400 metre long IP anomaly, 500 metres southwest of the Aidan Showing. In a trench excavated 1200 metres southwest of the Aidan Showing grab samples yielded values of up to 13.38 grams per tonne gold in silicified and quartz-veined gabbro associated with a 700 metre long geophysical anomaly. There appears to be a metal zonation within the gabbro from copper-nickel in the northeast through copper-gold to gold with minor copper in the southwest. Kodiak plans drilling the copper-nickel discovery in the near future.

The discoveries lie along strike from the Aidan Showing (5.5% copper, 0.375 grams per tonne gold; news release August 24, 2004), and were made as a result of mechanical stripping of a cluster of geophysical anomalies within the gabbro. Many geophysical

**Aidan Zone – Massive Pyrite-Pyrrhotite – 0.23% Cu, 0.46% Ni over 0.20 Metres**

zones remain to be stripped and sampled. Gabbro has been mapped for 10 kilometres west of the Aidan showing, within an area up to 2 kilometres wide, which falls entirely within Kodiak's claims. Kodiak plans to perform detailed mapping, geophysical and litho-geochemical surveys over the Aidan area and the gabbros along strike to the west in order to identify additional sulphide targets for drilling.

The new find, dubbed the Snake Zone, was discovered 30 metres west of the Aidan showing. It has been traced westward over a strike length of 165 metres. A second zone (J-5), is offset 40 metres from the Snake zone, and has been traced over a strike length of

Contact**

50 metres. The two zones range from 1.1 to 4.1 metres wide, and consist of disseminated, net-textured and massive pyrrhotite, chalcopyrite and local pyrite (see Snake Zone photograph). The mineralized zone also contains anomalous levels of cobalt, platinum, palladium and gold. The sulphides are associated with chlorite alteration, and lie within a gabbro close to its contact with felsic metavolcanic rocks and an ultramafic unit.

Highlights of the channel cuts are as follows:

Zone	Channel	From	To (m)	Width (m)	Cu (%)	Ni (%)
Aidan	AD-01	1.46	1.81	0.35	0.15	1.15
Aidan	AD-03	1.30	1.60	0.30	1.21	0.17
Snake	SN-02	0.60	2.90	2.30	0.44	0.44
Snake	SN-03	1.20	2.35	1.15	0.62	0.39
Snake	SN-04	0.80	4.80	4.00	0.46	0.31
Snake	SN-05	1.20	2.35	1.15	0.57	0.39
Snake	SN-06	17.50	21.60	4.10	0.49	0.55
Snake	Incl	18.50	20.50	2.00	0.58	0.78
J-5		2.70	6.55	3.85	1.03	0.52
J-5	Incl	3.70	5.65	1.95	1.30	0.56

Mechanical stripping, mapping and sampling are ongoing in preparation for drilling.

Kodiak is a well financed mineral exploration company with two properties located in Canada. The Knucklethumb property is located 210 kilometres northeast of Thunder Bay, Ontario, is 100 per cent controlled and road accessible. Maps, photographs, geological details and additional information may be reviewed on Kodiak's website at [www.kodiakexp.com](http://www.kodiakexp.com). The qualified person for this project, under the definitions established by National Instrument 43-101, is Christopher Marmont, MSC, PGeo.
